

Name Convention and Code Style

1. Variable names: lowercase with underscore between words.
Example: `variable_one`
2. Functions names: first letter of every word is capitalized. Underscore between words.
Example: `Function_One`
3. Class names: first letter of every word is capitalized. No underscore between words.
Example: `ClassOne`
4. Interface class names: 'I' (uppercase i) followed by class name.
Example: `IClassOne`
5. Protected class members: Double underscore followed with lowercase name. Underscore between words.
Example: `__member_one`
6. Private class members: Underscore followed with lowercase name. Underscore between words.
Example: `_member_one`
7. Enum: Class for every enum. Class name will be 'e' followed by class name. Enum members will be as function convention.
Example: `eNumOne` <- class name
 `Value_One` <- enum member
8. Consts: Uppercase with underscore between words.
Example: `CONST_ONE`
